SHORTENED STATUTORY PERIOD OF RESPONSE	MAIL DATE	DELIVERY MODE
3 MONTHS	02/27/2007	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

# Office Action Summary

Application No.

10/713,486

Applicant(s)

DAVID, HOWARD S.

Examiner

Ryan Dare

Art Unit

2186

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 27 November 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1,2,5-9,12-17,19,21-23,25-31,33-38 and 40-43 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1,2,5-9,12-17,19,21-23,25-31,33-38 and 40-43 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Oath/Declaration***

1. The oath or declaration is defective. A new oath or declaration in compliance with 37 CFR 1.67(a) identifying this application by application number and filing date is required. See MPEP §§ 602.01 and 602.02.

The oath or declaration submitted 11/27/06 is defective because it is not signed by the inventor.

### ***Response to Amendment***

2. The declaration filed on 11/27/06 under 37 CFR 1.131 has been considered but is ineffective to overcome the Brucke reference. The evidence submitted is insufficient to establish a conception of the invention prior to the effective date of the Brucke reference. While conception is the mental part of the inventive act, it must be capable of proof, such as by demonstrative evidence or by a complete disclosure to another. Conception is more than a vague idea of how to solve a problem. The requisite means themselves and their interaction must also be comprehended. See *Mergenthaler v. Scudder*, 1897 C.D. 724, 81 O.G. 1417 (D.C. Cir. 1897). Applicant has included a similar specification, but has not pointed out specifically how this version of the specification supports the claims in their current amended form. The affidavit or declaration and exhibits must clearly explain which facts or data applicant is relying on to show completion of his or her invention prior to the particular date. Vague and

general statements in broad terms about what the exhibits describe along with a general assertion that the exhibits describe a reduction to practice "amounts essentially to mere pleading, unsupported by proof or a showing of facts" and, thus, does not satisfy the requirements of 37 CFR 1.131(b). In re Borkowski, 505 F.2d 713, 184 USPQ 29 (CCPA 1974). Applicant must give a clear explanation of the exhibits pointing out exactly what facts are established and relied on by applicant. 505 F.2d at 718-19, 184 USPQ at 33. See also In re Harry, 333 F.2d 920, 142 USPQ 164 (CCPA 1964) (Affidavit "asserts that facts exist but does not tell what they are or when they occurred.").

3. The declaration filed on 11/27/06 under 37 CFR 1.131 is also deficient because it is not submitted and signed by a qualified party. 37 CFR 1.31 states:

- (a) When any claim of an application or a patent under reexamination is rejected, the inventor of the subject matter of the rejected claim, the owner of the patent under reexamination, or the party qualified under §§ 1.42, 1.43, or 1.47, may submit an appropriate oath or declaration to establish invention of the subject matter of the rejected claim prior to the effective date of the reference or activity on which the rejection is based. The effective date of a U.S. patent, U.S. patent

The present declaration is that of the attorney who prepared the present application, and not one of the qualified parties listed above, such as the inventor or the owner.

### ***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject

Art Unit: 2186

matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

6. Claims 5, 12 and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim, US PG Pub 2004/0093461, in view of Brucke, US PG Pub 2005/0088894.

7. With respect to claim 5, Kim teaches a method of operating a memory device having multiple memory bank arrays and being responsive to command signals and a plurality of bank address signals, the method comprising:

specifying at least one of a multiple of memory bank arrays to be refreshed using a plurality of bank address signals, in pars. 23-24;

initiating in response to first command signals an auto-refresh command controlling an auto refresh operation to the specified at least one of the multiple memory bank arrays, in pars. 23-24 and 27-28.

Kim fails to teach a staggered refresh. Brucke teaches a staggered refresh wherein multiple rows per memory bank array are refreshed in a staggered fashion per the auto-refresh, in par. 25.

8. It would be obvious to one of ordinary skill in the art, having the teachings of Kim and Brucke before him at the time the invention was made, to modify the memory refresh method of Kim with the memory refresh system of Brucke, in order to allow multiple rows to be refreshed in a staggered fashion with just one auto-refresh command, thereby decreasing the total refresh commands necessary to refresh a memory, as taught by Brucke in par. 25.

9. With respect to claim 12, Applicant claims an article comprising a storage medium having stored thereon instructions that when executed by a machine result in performing the method of claim 5, and is therefore rejected using similar logic.

10. With respect to claim 21, Kim teaches a memory device responsive to command signals and bank address signals, the memory device comprising:

multiple memory bank arrays, each memory bank array having storage cells, in the Abstract; and

a command controller/decoder responsive to selected command signals and bank address signals to initiate an auto-refresh command controlling an auto refresh operation to at least one specified memory bank array of the multiple memory bank arrays, in fig. 3, command decoder 20, and par. 36.

Art Unit: 2186

Kim fails to teach a staggered refresh. Brucke teaches a staggered refresh wherein multiple rows per memory bank array are refreshed in a staggered fashion per the auto-refresh, in par. 25.

11. It would be obvious to one of ordinary skill in the art, having the teachings of Kim and Brucke before him at the time the invention was made, to modify the memory refresh method of Kim with the memory refresh system of Brucke, in order to allow multiple rows to be refreshed in a staggered fashion with just one auto-refresh command, thereby decreasing the total refresh commands necessary to refresh a memory, as taught by Brucke in par. 25.

12. Claims 1-2, 6-9, 13-15, 23, 25-31, 33-38 and 40-43 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim, US PG Pub 2004/0093461, in view of Proebsting, US Patent 6,871,261, further in view of Brucke, US PG Pub 2005/0088894.

13. With respect to claim 1, Kim teaches a method of operating a memory device having multiple memory bank arrays and being responsive to command signals and a plurality of bank address signals, the method comprising:

specifying at least one of a multiple of memory bank arrays to be refreshed using a plurality of bank address signals, in pars. 23-24;

initiating in response to first command signals an auto-refresh command controlling an auto refresh operation to the specified at least one of the multiple memory bank arrays, in pars. 23-24 and 27-28.

Art Unit: 2186

Kim fails to teach the last limitation of claim 1. Proebsting teaches initiating, before or during the auto refresh operation to the at least one of the specified memory bank arrays, a second command signal controlling a second operation, other than an auto refresh operation, to a second memory bank array of the multiple memory bank arrays, which is not one of the at least one of the specified memory bank arrays being refreshed, in col. 2, lines 43-50.

Kim and Proebsting fail to teach a staggered refresh. Brucke teaches a staggered refresh wherein multiple rows per memory bank array are refreshed in a staggered fashion per the auto-refresh command and the second operation begins after all the rows have begun the auto refresh operation, in par. 25.

14. With respect to claim 2, Kim teaches the method of claim 1, wherein the specified at least one of the multiple memory bank arrays is specified in logic based on the plurality of bank address signals received, in pars. 27-28.

15. It would be obvious to one of ordinary skill in the art, having the teachings of Kim and Proebsting before him at the time the invention was made, to modify the memory refresh method of Kim with the memory refresh method of Proebsting, because it allows both operations to complete in the same clock cycle as taught by Proebsting in col. 2, lines 43-47. This makes it so that a read or write does not have to be stalled as long as the particular memory bank array is not being accessed, and thus saves time.

Furthermore, it would be obvious to one of ordinary skill in the art, having the teachings of Kim, Proebsting and Brucke before him at the time the invention was made, to modify the memory refresh method of Kim and Proebsting with the memory refresh system of

Art Unit: 2186

Brucke, in order to allow multiple rows to be refreshed in a staggered fashion with just one auto-refresh command, thereby decreasing the total refresh commands necessary to refresh a memory, as taught by Brucke in par. 25.

16. With respect to claim 6, Kim, Proebsting and Brucke teach all other limitations of the parent claim as discussed supra, but implements the invention on a DRAM and not on an SDRAM. As is known in the art, a SDRAM is simply a DRAM that employs a bursting technique that predicts the next memory location to be accessed. Therefore, benefits achieved by Kim's invention will have the same positive effect on an SDRAM as it will on a non-synchronous DRAM.

17. It would have been obvious to one of ordinary skill in the art at the time the invention was made, to implement the present invention on an SDRAM since this is a type of a DRAM which will also use the benefits achieved by the Kim invention, such as reducing power consumption and decreasing noise by reducing peak operation current, as taught by Kim in the last sentence of the Abstract.

18. With respect to claim 13, Applicant claims an article comprising a storage medium having stored thereon instructions that when executed by a machine result in performing the method of claim 6, and is therefore rejected using similar logic

19. With respect to claim 7, the combination of Kim, Proebsting and Brucke teaches all other limitations of the parent claim as discussed supra. Proebsting further teaches the method of claim 3, wherein the second operation is selected from the group consisting of activate operations, read operations, write operations and precharge operations, in col. 2, lines 43-50. Although Proebsting only mentions read and write

Art Unit: 2186

operations, in view of Applicant's Related Art, it is inherent that these include activate and precharge operations. Applicant discloses that access operations include activate and precharge operations in page 1, line 17, through page 2, line 13. Therefore, Proebsting also teaches performing activate and precharge operations since these are inherent to the read and write operations it discloses.

20. With respect to claims 8-9, Applicant claims an article comprising a storage medium having stored thereon instructions that when executed by a machine result in performing the method of claims 1-2, and are therefore rejected using similar logic.

21. With respect to claim 14, Applicant claims an article comprising a storage medium having stored thereon instructions that when executed by a machine result in performing the method of claim 7, and is therefore rejected using similar logic.

22. With respect to claim 15, Kim teaches a memory device responsive to command signals and bank address signals, the memory device comprising:

multiple memory bank arrays, each memory bank array having storage cells, in the Abstract; and

a command controller/decoder responsive to selected command signals and bank address signals to initiate an auto-refresh command controlling an auto refresh operation to at least one specified memory bank array of the multiple memory bank arrays, in fig. 3, command decoder 20, and par. 36.

Kim fails to teach the last part of claim 1. Proebsting teaches: before or during the auto refresh operation to the at least one of the specified memory bank arrays, issuing a second command signal controlling a second operation, other than an auto

Art Unit: 2186

refresh operation, to a second memory bank array of the multiple memory bank arrays, which is not one of the at least one of the specified memory bank arrays being refreshed, in col. 2, lines 43-50.

Kim and Proebsting fail to teach a staggered refresh. Brucke teaches a staggered refresh wherein multiple rows per memory bank array are refreshed in a staggered fashion per the auto-refresh command and the second operation begins after all the rows have begun the auto refresh operation, in par. 25.

23. It would be obvious to one of ordinary skill in the art, having the teachings of Kim and Proebsting before him at the time the invention was made, to modify the memory refresh method of Kim with the memory refresh method of Proebsting, because it allows both operations to complete in the same clock cycle as taught by Proebsting in col. 2, lines 43-47. This makes it so that a read or write does not have to be stalled as long as the particular memory bank array is not being accessed, and thus saves time.

Furthermore, it would be obvious to one of ordinary skill in the art, having the teachings of Kim, Proebsting and Brucke before him at the time the invention was made, to modify the memory refresh method of Kim and Proebsting with the memory refresh system of Brucke, in order to allow multiple rows to be refreshed in a staggered fashion with just one auto-refresh command, thereby decreasing the total refresh commands necessary to refresh a memory, as taught by Brucke in par. 25.

24. With respect to claim 23, Proebsting teaches the memory device of claim 15, wherein the second operation is selected from the group consisting of activate operations, read operations, write operations and precharge operations, in col. 2, lines

Art Unit: 2186

43-50. Although Proebsting only mentions read and write operations, in view of Applicant's Related Art, it is inherent that these include activate and precharge operations. Applicant discloses that access operations include activate and precharge operations in page 1, line 17, through page 2, line 13. Therefore, Proebsting also teaches performing activate and precharge operations since these are inherent to the read and write operations it discloses.

25. With respect to claim 26, Kim teaches a method of operating a device having multiple memory bank arrays and being responsive to command signals and a plurality of bank address signals, the method comprising:

specifying at least one of a multiple of memory bank arrays to be refreshed using a plurality of bank address signals, in pars. 23-24; and

initiating in response to first command signals an auto-refresh command controlling an auto refresh operation to the specified at least one of the multiple memory bank arrays, wherein multiple rows per memory bank array are refreshed per auto-refresh command, in pars. 23-24 and 27-28.

Proebsting teaches:

initiating, before or during the auto refresh operation to the at least one of the specified memory bank arrays, a second command signal controlling a second operation, other than an auto refresh operation, to a second memory bank array of the multiple memory bank arrays, which is not one of the at least one of the specified memory bank arrays being refreshed, in col. 2, lines 43-50.

Kim and Proebsting fail to teach a staggered refresh. Brucke teaches a staggered refresh wherein multiple rows per memory bank array are refreshed in a staggered fashion per the auto-refresh command and the second operation begins after all the rows have begun the auto refresh operation, in par. 25.

26. It would be obvious to one of ordinary skill in the art, having the teachings of Kim and Proebsting before him at the time the invention was made, to modify the memory refresh method of Kim with the memory refresh method of Proebsting, because it allows both operations to complete in the same clock cycle as taught by Proebsting in col. 2, lines 43-47. This makes it so that a read or write does not have to be stalled as long as the particular memory bank array is not being accessed, and thus saves time.

Furthermore, it would be obvious to one of ordinary skill in the art, having the teachings of Kim, Proebsting and Brucke before him at the time the invention was made, to modify the memory refresh method of Kim and Proebsting with the memory refresh system of Brucke, in order to allow multiple rows to be refreshed in a staggered fashion with just one auto-refresh command, thereby decreasing the total refresh commands necessary to refresh a memory, as taught by Brucke in par. 25.

27. With respect to claim 25, Kim teaches a method of claim 26, wherein the specified at least one of the multiple memory bank arrays is specified in logic based on the plurality of bank address signals received, in pars. 27-28.

28. With respect to claim 27, Kim, Proebsting and Brucke teach all other limitations of the parent claim as discussed supra, but implements the invention on a DRAM and not on an SDRAM. As is known in the art, a SDRAM is simply a DRAM that employs a

Art Unit: 2186

bursting technique that predicts the next memory location to be accessed. Therefore, benefits achieved by Kim, Proebsting's and Brucke's invention will have the same positive effect on an SDRAM as it will on a non-synchronous DRAM.

29. It would have been obvious to one of ordinary skill in the art at the time the invention was made, to implement the invention of Kim, Proebsting and Brucke on an SDRAM since this is a type of a DRAM which will also use the benefits achieved by the Kim, Proebsting and Brucke inventions, such as reducing power consumption and decreasing noise by reducing peak operation current, as taught by Kim in the last sentence of the Abstract.

30. With respect to claim 28, Kim, Proebsting and Brucke teach all other limitations of the parent claim as discussed supra. Proebsting further teaches the method of claim 26, wherein the second operation is selected from the group consisting of activate operations, read operations, write operations and precharge operations, in col. 2, lines 43-50. Although Proebsting only mentions read and write operations, in view of Applicant's Related Art, it is inherent that these include activate and precharge operations. Applicant discloses that access operations include activate and precharge operations in page 1, line 17, through page 2, line 13. Therefore, Proebsting also teaches performing activate and precharge operations since these are inherent to the read and write operations it discloses.

31. With respect to claim 29, Kim, Proebsting and Brucke teach all other limitations of the parent claims as discussed supra. Proebsting further teaches the method of claim 28, wherein second command signals, to initiate an activate operation to open a

Art Unit: 2186

page not to be refreshed, are issued by the memory controller after first command signals to initiate an auto-refresh command controlling an auto refresh operation to the specified at least one of the multiple memory bank arrays to be refreshed, in preparation for issuing second command signals to initiate read operations or write operations to the open page. Although Proebsting does not expressly mention performing the activate operation before the read or write, it would be obvious to one of ordinary skill in the art to do activate a row before reading from it. This is taught by Applicant in the Discussion of Related Art on page 2, lines 3-13. Since an activation is a necessary part of a read or write, this would be an essential and obvious operation to perform.

32. With respect to claim 30, Kim teaches a memory controller for controlling a memory device having multiple memory bank arrays comprising:

a processor for scheduling and generating a plurality of bank address signals, first command signals, and second command signals, wherein the plurality of bank address signals specifies at least one of a multiple of memory bank arrays to be refreshed, the first command signals initiate an auto-refresh command controlling an auto refresh operation to the specified at least one of multiple memory bank arrays, in pars. 23-24 and 27-28. Kim fails to teach the second command signals that read or write from another memory bank array.

Proebsting teaches second command signals that initiate, before or during the auto refresh operation to the at least one of the specified memory bank arrays, a second command controlling a second operation, other than an auto refresh operation, to a second memory bank array of the multiple memory bank arrays, which is not one of

the at least one of the specified memory bank arrays being refreshed, in col. 2, lines 43-50.

Kim and Proebsting fail to teach a staggered refresh. Brucke teaches a staggered refresh wherein multiple rows per memory bank array are refreshed in a staggered fashion per the auto-refresh command and the second operation begins after all the rows have begun the auto refresh operation, in par. 25.

33. It would be obvious to one of ordinary skill in the art, having the teachings of Kim and Proebsting before him at the time the invention was made, to modify the memory refresh method of Kim with the memory refresh method of Proebsting, because it allows both operations to complete in the same clock cycle as taught by Proebsting in col. 2, lines 43-47. This makes it so that a read or write does not have to be stalled as long as the particular memory bank array is not being accessed, and thus saves time.

Furthermore, it would be obvious to one of ordinary skill in the art, having the teachings of Kim, Proebsting and Brucke before him at the time the invention was made, to modify the memory refresh method of Kim and Proebsting with the memory refresh system of Brucke, in order to allow multiple rows to be refreshed in a staggered fashion with just one auto-refresh command, thereby decreasing the total refresh commands necessary to refresh a memory, as taught by Brucke in par. 25.

34. With respect to claim 31, Kim teaches the memory controller of claim 30, wherein the specified at least one of the multiple memory bank arrays is specified in logic based on the plurality of bank address signals received, in pars. 27-28.

35. With respect to claim 33, Kim teaches a memory controller for controlling a memory device having multiple memory bank arrays comprising:

a processor for scheduling and generating a plurality of bank address signals, first command signals, and second command signals, wherein the plurality of bank address signals specifies at least one of a multiple of memory bank arrays to be refreshed, the first command signals initiate an auto-refresh command controlling an auto refresh operation to the specified at least one of multiple memory bank arrays, in pars. 23-24 and 27-28. Kim fails to teach the second command signals that read or write from another memory bank array.

Proebsting teaches second command signals that initiate, before or during the auto refresh operation to the at least one of the specified memory bank arrays, a second command controlling a second operation, other than an auto refresh operation, to a second memory bank array of the multiple memory bank arrays, which is not one of the at least one of the specified memory bank arrays being refreshed, in col. 2, lines 43-50.

Kim and Proebsting fail to teach a staggered refresh. Brucke teaches a staggered refresh wherein multiple rows per memory bank array are refreshed in a staggered fashion per the auto-refresh command, in par. 25.

36. It would be obvious to one of ordinary skill in the art, having the teachings of Kim and Proebsting before him at the time the invention was made, to modify the memory refresh method of Kim with the memory refresh method of Proebsting, because it allows both operations to complete in the same clock cycle as taught by Proebsting in col. 2,

Art Unit: 2186

lines 43-47. This makes it so that a read or write does not have to be stalled as long as the particular memory bank array is not being accessed, and thus saves time.

Furthermore, it would be obvious to one of ordinary skill in the art, having the teachings of Kim, Proebsting and Brucke before him at the time the invention was made, to modify the memory refresh method of Kim and Proebsting with the memory refresh system of Brucke, in order to allow multiple rows to be refreshed in a staggered fashion with just one auto-refresh command, thereby decreasing the total refresh commands necessary to refresh a memory, as taught by Brucke in par. 25.

37. With respect to claim 34, Kim and Proebsting teach all other limitations of the parent claim as discussed supra, but implement the invention on a DRAM and not on an SDRAM. As is known in the art, a SDRAM is simply a DRAM that employs a bursting technique that predicts the next memory location to be accessed. Therefore, benefits achieved by Kim and Proebsting's invention will have the same positive effect on an SDRAM as it will on a non-synchronous DRAM.

38. It would have been obvious to one of ordinary skill in the art at the time the invention was made, to implement the invention of Kim and Proebsting on an SDRAM since this is a type of a DRAM which will also use the benefits achieved by the Kim and Proebsting inventions, such as reducing power consumption and decreasing noise by reducing peak operation current, as taught by Kim in the last sentence of the Abstract.

39. With respect to claim 35, the combination of Kim and Proebsting teaches all other limitations of the parent claim as discussed supra. Proebsting further teaches the memory controller of claim 30, wherein the second operation is selected from the group

Art Unit: 2186

consisting of activate operations, read operations, write operations and precharge operations, in col. 2, lines 43-50. Although Proebsting only mentions read and write operations, in view of Applicant's Related Art, it is inherent that these include activate and precharge operations. Applicant discloses that access operations include activate and precharge operations in page 1, line 17, through page 2, line 13. Therefore, Proebsting also teaches performing activate and precharge operations since these are inherent to the read and write operations it discloses.

40. With respect to claim 36, Kim and Proebsting teach all other limitations of the parent claims as discussed supra. Proebsting further teaches the memory controller of claim 35, wherein second command signals, to initiate an activate operation to open a page not to be refreshed, are issued by the memory controller after first command signals to initiate an auto-refresh command controlling an auto refresh operation to the specified at least one of the multiple memory bank arrays to be refreshed, in preparation for issuing second command signals to initiate read operations or write operations to the open page. Although Proebsting does not expressly mention performing the activate operation before the read or write, it would be obvious to one of ordinary skill in the art to do activate a row before reading from it. This is taught by Applicant in the Discussion of Related Art on page 2, lines 3-13. Since an activation is a necessary part of a read or write, this would be an essential and obvious operation to perform.

41. With respect to claims 37-38 and 40-43, Applicant claims a system that comprises the memory device and controller of claims 30-31 and 33-36, and is therefore rejected using similar logic.

42. Claims 16-17, 19 and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim, Proebsting and Brucke as applied to claims 1-2, 6-9, 13-15, 23, 25-31, 33-38 and 40-43 above, in view of Zheng, US Patent 6,195,303.

43. With respect to claim 16, Kim, Proebsting and Brucke teach all other limitations of the parent claim as discussed supra, but fails to teach an order of refreshing as described in claim 16. Zheng teaches a memory device, wherein the at least one specified memory bank array of the multiple memory bank arrays is determined based on which memory bank arrays have been refreshed and a subsequent known order of refreshing the memory bank arrays, in col. 3, lines 33-39.

44. It would have been obvious to one of ordinary skill in the art, having the teachings of Kim, Proebsting, Brucke, and Zheng before him at the time the invention was made, to modify the memory refresh method of Kim, Proebsting and Brucke with the memory refresh method of Zheng, in order to reduce the overhead required to operate the DRAM, since refreshes will occur automatically without external commands, and will be timed such that data is never lost, as taught by Zheng in col. 12, lines 1-9.

45. With respect to claim 17, Zheng teaches the method of claim 16, wherein the at least one specified memory bank array of the multiple memory bank arrays is determined based on a command specifying which bank is to be next refreshed and a subsequent known order of refreshing the memory bank arrays, in col. 3, lines 33-39.

46. With respect to claim 19, Zheng teaches the memory device of claim 15, further comprising a refresh counter for incrementing an address of a row to be refreshed,

wherein the refresh counter has a separate counter portion for each of the multiple memory bank arrays, in col. 9, lines 12-20.

47. With respect to claim 22, Kim, Proebsting, Brucke and Zheng teach all other limitations of the parent claim as discussed supra, but implements the invention on a DRAM and not on an SDRAM. As is known in the art, a SDRAM is simply a DRAM that employs a bursting technique that predicts the next memory location to be accessed. Therefore, benefits achieved by Kim and Zheng's invention will have the same positive effect on an SDRAM as it will on a non-synchronous DRAM.

48. It would have been obvious to one of ordinary skill in the art at the time the invention was made, to implement the invention of Kim and Zheng on an SDRAM since this is a type of a DRAM which will also use the benefits achieved by the Kim and Zheng inventions, such as reducing power consumption and decreasing noise by reducing peak operation current, as taught by Kim in the last sentence of the Abstract.

### ***Conclusion***

49. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the

Art Unit: 2186

shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

50. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ryan Dare whose telephone number is (571)272-4069. The examiner can normally be reached on Mon-Fri 9:30-6.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matt Kim can be reached on (571)272-4182. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
